Install Python

Download python 3.10 interpreter for windows with following link:

<https://www.python.org/ftp/python/3.10.3/python-3.10.3-amd64.exe>

To start this web app, follow the steps below:

- In file explorer, go to recipe web folder. In folder open command prompt
- In command prompt type:

 `rep\Scripts\Activate`
- This will activate the virtual environment named 'rep'. This contains all dependencies.
- After activating the virtual environment type following in command prompt:

 `python manage.py runserver`
- This will run the deployment server.
- After doing this open browser and in browser go to local host. Your web app is in local host.

Important Notes:

In order to send email to users you have to provide an email in settings

1. In repapp folder, go to settings.py
2. At the end of settings.py, you'll see two commented variables. Uncomment them and put your email
3. and app password or original password in double quotes
4. Similarly, go to views.py in recipe folder. In recipe_detail view, you'll see a commented from email.
5. Uncomment it put the same email in that place or you can leave it empty. In that case it will use the email provided in settings.
6. Similarly, in contact_view provide the email in recipient_list.
